

Weekly Task Verification

Date: January 25, 2025

Team: Frontend & Backend Development

Report Period: Jan 20 - Jan 23, 2025

Task Completion Verification

Completed (Contech)

- Role-based access control is implemented and enforced.
- Project creation, visibility, and basic lifecycle tracking work
- Task and milestone management functions as intended
- Admin and progress metrics are available.
- Users can participate in multiple projects as assigned.

Pending / In Progress (Contech)

- Missing public ConTech contact endpoint
- Some role actions are limited or missing at the project level.
- Missing public ConTech contact endpoint.
- Media and document handling lacks structure.

3. Quick Feature Validation Checklist

Contech Module Quick Tests (Backend)

ADMIN ROLE

Feature	Status	Issue
Create/manage clients	Partial	Clients are stored as ConTech user profiles — no dedicated <code>Client</code> resource, metadata, or client-specific CRUD.
Create/manage contractors	Implemented	Managed via ConTech profiles; no contractor-specific entity (works but uses user profile table).
Create/manage projects	Implemented(Partially)	<code>create()</code> auto-assigns <code>contractorId</code> to creator and sets status = PLANNED (likely unintended).
Assign contractors/clients at create	Partial	<code>clientId</code> supported at create; <code>contractorId</code> cannot be provided on create (must PATCH afterward).

View all projects & dashboards	Implemented	No issue.(GET /projects/stats provide admin visibility.)
Monitor overall progress	Implemented	No issue.(getProjectStats returns ACTIVE/PLANNED/COMPLETED counts.)

CONTRACTOR ROLE

Feature	Status	Evidence	Issue
View only projects they are assigned to	Implemented	projects.service.ts, projects.controller.ts	findAll/findOne do filter by contractor role—add contractor-scoped filters when contexProfile.role === 'CONTRACTOR'.
Update project progress (project-level)	Not Implemented(project-level) / Partially (task-level)	Project status: projects.service.updateStatus; Task progress: tasks.service.ts:81	Contractors can update task progress and milestones but cannot change project status—decide whether to allow limited project progress updates for contractors.
Manage tasks and milestones	Implemented(scoped)	tasks.service.ts, milestones.controller.ts	Access checks ensure contractor can act if Project.contractorId === user.firebaseId or task.assignedTo === user.
Cannot create or delete projects or users	Mostly implemented	Create: projects.controller.ts#create, Service checks in projects.service.ts	Creation restricted to ADMIN; deletion limited to ADMIN. User creation handled in Auth/Careers services—ensure Admin-only flows there.
Can be assigned to multiple projects	Implemented	prisma/schema.prisma (Project.contractorId indexed)	Schema supports reuse of contractor IDs across projects.
Cannot access projects they are not assigned to	Implemented	See findAll/findOne in projects.service.ts	findAll / findOne RBAC filter checks contractorId and clientId (projects.service.ts)

Client (/client) Role

Feature	Status	Evidence	Issue
View only projects they are assigned	Implemented	projects.service.ts (filters by clientId)	—

to			
View uploaded photos, documents, and reports	Partially implemented	Photos: schema.prisma + updatePhotos() in projects.service.ts; Reports: client-report.service.ts	Photos stored as <code>String[]</code> (no per-photo metadata). Documents: no <code>ProjectDocument</code> model or <code>/projects/:id/documents</code> route
Cannot edit project data (client is read-only)	Implemented	ProjectsService.update enforces ADMIN-only in projects.service.ts	—
Clients created by Admin (onboarding)	Partially implemented / undocumented	User creation exists in auth-service; scripts in auth-service	No explicit/documented admin-provisioning endpoint in ConTech (flow lives in auth-service)
May have multiple projects	Implemented	Project.clientId in prisma/schema.prisma supports multiple projects per client	—
Only see what Admin/Contractor expose to them	Partially enforced	Multiple services check if (profile.role === 'CLIENT' && project.clientId !== user.firebaseId) across codebase (projects, tasks, milestones, client-report)	Enforcement present but coverage should be validated end-to-end (messages/docs not implemented)

[TEST-01] Admin cannot assign contractor at project creation

Status:

Project:	ALIKOHUB CONTECH
-----------------	----------------------------------

Component	Contech	Priority:	Medium
------------------	---------	------------------	--------

Description	Admins can call the project create endpoint but cannot assign the intended contractor at creation. The backend auto-assigns contractorId/inspectorId to the creating user and sets status to PLANNED, so the intended contractor doesn't see the project until an update is performed.
--------------------	--

Steps to Reproduce

1. POST to POST /projects as Admin with a clientId (no contractor id field is supported).
2. Inspect the created project → contractorId == Admin's firebaseId,, status == PLANNED.
3. Intended contractor cannot list or see the project until PATCH /projects/:id sets their contractorId.

Expected result:

- contractorId : Admin may optionally provide contractorId at creation and those values are persisted.
- status: either remain PLANNED by default or accept an explicit status/activation flag per product decision like ACTIVE— but Admin should be able to create and immediately assign the correct contractor so they can see the project.

Actual result:

- contractorId / inspectorId: set to the Admin (creator) firebaseId.
- status: set to PLANNED.
- visibility: Intended contractor does not see the project until a follow-up PATCH assigns them.

Fix:

- Update CreateProjectDto to include optional fields: contractorId to string
- Update ProjectsService.create():
 - If dto.contractorId provided, validate/ensure profiles via await this.userService.ensureProfileExists(id) (or fail/return validation error if invalid).
 - persist provided IDs.
 - Otherwise default to user.firebaseId (preserve current behavior).
- Status handling: decide product behavior:
Option A: if creator is Admin, set status = 'ACTIVE', or Option B: accept status in DTO (with validation) or keep PLANNED and Project activation flow.

[TEST-02] Project create: unsafe date defaulting (startDate/endDate)

Status:	
----------------	--

Status:	
Project:	ALIKOHUB CONTECH

Component	Contech	Priority:	Medium
------------------	---------	------------------	--------

Description	There is no dedicated, validated API for contractors to submit progress percentages or structured progress updates. Current updateStatus() allows status changes but no progress endpoint or server-side validation of progress updates; milestones update exists but is fragmented.
--------------------	--

Steps to Reproduce

1. Obtain a contractor token.
2. Attempt POST /contractor/projects/:id/progress (**route not present**) or PATCH /projects/:id with { progress: 45 }.

Expected: API accepts a well-formed progress update, validates contractor is assigned to project, stores progress and updatedBy metadata.

Actual: No dedicated /contractor/projects/:id/progress route (404). PATCH may be unsupported or restricted; progress field exists on model but no validated endpoint or audit fields.

Fix: Add POST /contractor/projects/:id/progress (or extend PATCH) with request validation, require $0 \leq \text{progress} \leq 100$, require `project.contractorId === user.firebaseId`, record updatedBy and timestamp

[TEST-04] Missing Weekly/Textual Updates

Status:	
Project:	ALIKOHUB CONTECH

Component	Contech	Priority:	Medium
------------------	---------	------------------	--------

Description	No WeeklyUpdate or textual update model/endpoints for contractors to add scheduled narrative updates (summaries). Clients and audit require textual logs.
--------------------	---

Steps to Reproduce

1. Attempt POST /projects/:id/updates or POST /contractor/projects/:id/updates with { text: "Weekly summary..." }.

Expected: 201 Created with stored summary, author, and timestamp.

Actual: Endpoint missing (404).

Fix: Add ProjectUpdate (id, projectId, authorId, text, createdAt) and gateway routes /projects/:id/updates and /contractor/projects/:id/updates. Enforce assignment check and pagination.

Closed Issues(Regression Test Result)**1. [TEST-01] Admin Panel UI Issues - Duplicate Elements**

-Implemented

2. [TEST-02] Teacher Applications API

-Approval without review: updateTeacherApplicationStatus() allows updating status (e.g., to APPROVED) without enforcing reviewedBy, reviewNotes, or checking formData completeness — so approvals without review are possible.

- Fake resume URL: there is no HTTP check or file-type validation; only URL syntax is checked.

3. [TEST-04] Admin Dashboard (Create Recruiter Form)

- Blocking invalid submits — Not implemented:

Frontend form relies on HTML required and only disables submit while creating (isCreating). No formRef.checkValidity() or disabled-until-valid logic.

- Server-side validation & inline field errors — Partially implemented (backend), but not surfaced client-side:

Backend checks/throws for duplicates and validation (Auth & API gateway): careers.controller.ts and auth.service.ts perform DB + Firebase checks and return RpcExceptions.

Frontend shows only a generic error message; it does not parse or display structured field errors from the API. See admin-dashboard.tsx:1-200 and recruiter client

[recruiter-service.ts:1-80](#).

- Duplicate-email race / DB vs Firebase out-of-sync — Largely mitigated

4. [TEST-05] JobType enum mismatch (frontend vs backend)(Not implemented)

Frontend still uses INTERN for job type while backend expects INTERNSHIP and also supports FREELANCE. This enum mismatch causes 400 validation errors or bad DB values.

5. [TEST-06] Missing salary wording: jobs created without salary range render no explicit salary message

Salary fallback missing: job-page.tsx renders salary only when present (job.salaryRange && ...), so it shows blank when omitted; elsewhere (e.g. JobsHomePage.tsx) there is a "Not specified" or "required" fallback.

6. [TEST-07] Resume URL not validated/filtered

-Implemented

7. [TEST-08] Missing ownership/authorization check on update

-Implemented
